## 1 Completeness

### 1.1 Henkin's Theorem

Recall that we fix a set  $\Phi$  of  $S$ -formulas.

**Definition 1.1.** (i)  $\Phi$  is **negation complete** if for every  $S$ -formula  $\varphi$

$$\Phi \vdash \varphi \quad \text{or} \quad \Phi \vdash \neg\varphi.$$

(ii)  $\Phi$  **contains witnesses** if for every  $S$ -formula  $\varphi$  and every variable  $x$  there is a term  $t \in T^S$  with

$$\Phi \vdash \left( \exists x \varphi \rightarrow \varphi \frac{t}{x} \right). \quad \dashv$$

**Theorem 1.2** (Henkin's Theorem). *Let  $\Phi \subseteq L^S$  be consistent, negation complete, and contain witnesses. Then for every  $S$ -formula  $\varphi$*

$$\mathcal{J}^\Phi \models \varphi \iff \Phi \vdash \varphi.$$

**Corollary 1.3.** *Let  $\Phi \subseteq L^S$  be consistent, negation complete, and contain witnesses. Then*

$$\mathcal{J}^\Phi \models \Phi.$$

*In particular,  $\Phi$  is satisfiable.*

### 1.2 The countable case

We fix a symbol set  $S$  which is at most countable. As a consequence, both  $T^S$  and  $L^S$  are countable. Let  $\Phi \subseteq L^S$  we define

$$\text{free}(\Phi) := \bigcup_{\varphi \in \Phi} \text{free}(\varphi).$$

We will prove the following two lemmas.

**Lemma 1.4.** *Let  $\Phi \subseteq L^S$  be consistent with **finite**  $\text{free}(\Phi)$ . Then there is a consistent  $\Psi$  with  $\Phi \subseteq \Psi \subseteq L^S$  such that  $\Psi$  contains witnesses.*

**Lemma 1.5.** *Let  $\Psi \subseteq L^S$  be consistent. Then there is a consistent  $\Theta$  with  $\Psi \subseteq \Theta \subseteq L^S$  such that  $\Theta$  is negation complete.*

**Corollary 1.6.** *Let  $\Phi \subseteq L^S$  be consistent with finite  $\text{free}(\Phi)$ . Then there is a  $\Theta$  such that*

- $\Phi \subseteq \Theta \subseteq L^S$ ;
- $\Theta$  is consistent, negation complete, and contains witnesses.

**Corollary 1.7.** Let  $\Phi \subseteq L^S$  be consistent with finite  $\text{free}(\Phi)$ . Then  $\Phi$  is satisfiable.

*Proof:* By Corollary 1.6 and Corollary 1.3. □

*Proof of Lemma 1.4:* Recall  $L^S$  is countable, thus we can enumerate all S-formulas

$$\exists x_0 \varphi_0, \exists x_1 \varphi_1, \dots,$$

which start with an existential quantifier. Then we define inductively for every  $n \in \mathbb{N}$  an S-formula  $\psi_n$  as follows. Assume that  $\psi_m$  has been defined for all  $m < n$ . Let

$$i_n := \min\{i \in \mathbb{N} \mid v_i \notin \text{free}(\Phi \cup \{\psi_m \mid m < n\} \cup \{\exists x_n \varphi_n\})\}.$$

That is,  $i_n$  is the smallest index  $i$  such that  $v_i$  is not free in  $\Phi \cup \{\psi_m \mid m < n\} \cup \{\exists x_n \varphi_n\}$ . Then we set

$$\psi_n := \left( \exists x_n \varphi_n \rightarrow \varphi_n \frac{v_{i_n}}{x_n} \right).$$

Next, let

$$\Phi_n := \Phi \cup \{\psi_m \mid m < n\},$$

and  $\Psi := \bigcup_{n \in \mathbb{N}} \Phi_n$ . It should be clear that  $\Phi$  contains witness. So what remains is to show that  $\Psi$  is consistent, or equivalently every  $\Phi_n$  is consistent.

Recall that  $\Phi_0 = \Phi$  is consistent by our assumption. Towards a contradiction, assume that  $\Phi_n$  is consistent, but  $\Phi_{n+1}$  is not. Therefore, for every  $\chi$  with  $v_{i_n} \notin \text{free}(\chi)$  there is a finite  $\Gamma \subseteq \Phi_n$  with the following deduction.

$$\begin{array}{llll}
 \vdots & & & \\
 \text{m.} & \Gamma & \left( \neg \exists x_n \varphi_n \vee \varphi_n \frac{v_{i_n}}{x_n} \right) & \chi \\
 (\text{m} + 1). & \Gamma & \neg \exists x_n \varphi_n & \neg \exists x_n \varphi_n \quad (\text{assumption}) \\
 (\text{m} + 2). & \Gamma & \neg \exists x_n \varphi_n & \left( \neg \exists x_n \varphi_n \vee \varphi_n \frac{v_{i_n}}{x_n} \right) \quad (\text{V-introduction in the succedent}) \\
 (\text{m} + 3). & \Gamma & \neg \exists x_n \varphi_n & \chi \quad (\text{chain rule}) \\
 \vdots & & & \\
 (\ell). & \Gamma & \varphi_n \frac{v_{i_n}}{x_n} & \chi \quad (\text{similarly}) \\
 (\ell + 1). & \Gamma & \exists x_n \varphi_n & \chi \quad (\exists\text{-introduction in the antecedent}) \\
 (\ell + 2). & \Gamma & & \chi \quad (\text{case analysis}).
 \end{array}$$

Now by taking  $\chi := \exists v_0 v_0 \equiv v_0$  and  $\chi := \neg \exists v_0 v_0 \equiv v_0$  we conclude that  $\Phi_n$  is inconsistent, which contradicts our assumption. □

*Proof of Lemma 1.5:* Let  $\varphi_0, \varphi_1, \dots$  be an enumeration of  $L^S$ . For every  $n \in \mathbb{N}$  we define  $\Theta_n$  by induction. First  $\Theta_0 := \Psi$ . Then,

$$\Theta_{n+1} := \begin{cases} \Theta_n \cup \{\varphi_n\} & \text{if } \Theta_n \cup \{\varphi_n\} \text{ is consistent,} \\ \Theta_n & \text{otherwise.} \end{cases}$$

It is immediate that every  $\Theta_n$  is consistent, and the consistency of

$$\Theta := \bigcup_{n \in \mathbb{N}} \Theta_n$$

follows. To see that  $\Theta$  is negation complete, let  $\varphi \in L^S$ , in particular  $\varphi = \varphi_n$  for some  $n \in \mathbb{N}$ . Assuming  $\Theta \not\vdash \neg\varphi_n$ , we conclude  $\Theta_n \not\vdash \neg\varphi_n$  by  $\Theta_n \subseteq \Theta$ . Therefore,  $\Theta_n \cup \{\varphi\}$  is consistent. It follows that  $\varphi \in \Theta_{n+1} \subseteq \Theta$ , and thus  $\Theta \vdash \varphi$ .  $\square$

In the next step we eliminate the condition  $\text{free}(\Phi)$  being finite.

**Corollary 1.8.** *Let  $S$  be countable and  $\Phi \subseteq L^S$  consistent. Then  $\Phi$  is satisfiable.*

*Proof:* First, we let

$$S' := S \cup \{c_0, c_1, \dots\}.$$

For every  $\varphi \in L^S$  we define

$$n(\varphi) := \min\{n \mid \text{free}(\varphi) \subseteq \{v_0, \dots, v_{n-1}\}, \text{ i.e., } \varphi \in L_n^S\},$$

and let

$$\varphi' := \varphi \frac{c_0 \dots c_{n(\varphi)-1}}{v_0 \dots v_{n(\varphi)-1}}.$$

Then we set

$$\Phi' := \{\varphi' \mid \varphi \in \Phi\} \subseteq L^{S'}$$

Note  $\text{free}(\Phi') = \emptyset$ .

Claim.  $\Phi'$  is consistent.

Once we establish the claim, together with  $\text{free}(\Phi') = \emptyset$ , Corollary 1.6 implies that there is an  $S'$ -interpretation  $\mathcal{J}' = (\mathfrak{A}', \beta')$  such that  $\mathcal{J}' \models \Phi'$ . Applying the Coincidence Lemma with  $\text{free}(\Phi') = \emptyset$ , we can assume without loss of generality that

$$\beta'(v_i) = c_i^{\mathfrak{A}'} = \mathcal{J}'(c_i). \quad (1)$$

It follows that for every  $\varphi \in \Phi$

$$\begin{aligned} \mathcal{J}' \models \varphi' &\iff \mathcal{J}' \models \varphi \frac{c_0 \dots c_{n(\varphi)-1}}{v_0 \dots v_{n(\varphi)-1}} \\ &\iff \mathcal{J}' \frac{\mathcal{J}'(c_0) \dots \mathcal{J}'(c_{n(\varphi)-1})}{v_0 \dots v_{n(\varphi)-1}} \models \varphi && \text{(by the Substitution Lemma)} \\ &\iff \mathcal{J}' \frac{\beta'(v_0) \dots \beta'(v_{n(\varphi)-1})}{v_0 \dots v_{n(\varphi)-1}} \models \varphi && \text{(by (1))} \\ &\text{i.e., } \mathcal{J}' \models \varphi. \end{aligned}$$

That is,  $\mathcal{J}'$  is a model for every  $\varphi \in \Phi$ . We conclude that  $\Phi$  is satisfiable.

Now we prove the claim. It suffices to show that every finite subset of  $\Phi'$  is satisfiable. To that end, let

$$\Phi'_0 := \{\varphi'_1, \dots, \varphi'_n\},$$

where  $\varphi_1, \dots, \varphi_n \in \Phi$ . Clearly  $\text{free}(\{\varphi_1, \dots, \varphi_n\})$  is finite, and  $\{\varphi_1, \dots, \varphi_n\}$  is consistent by the consistency of  $\Phi$ . By Corollary 1.6 there is an  $S$ -interpretation  $\mathcal{J} = (\mathfrak{A}, \beta)$  such that for every  $i \in [n]$

$$\mathcal{J} \models \varphi_i. \quad (2)$$

We expand the  $S$ -structure  $\mathfrak{A}$  to an  $S'$ -structure  $\mathfrak{A}'$  by setting for every  $i \in \mathbb{N}$

$$c_i^{\mathfrak{A}'} := \beta(v_i). \quad (3)$$

Then for the  $S'$ -interpretation  $\mathcal{I}' := (\mathfrak{A}', \beta)$  and any  $\varphi \in L^S$

$$\begin{aligned}
\mathcal{I}' \models \varphi' &\iff \mathcal{I}' \models \varphi \frac{c_0 \cdots c_{n(\varphi)-1}}{v_0 \cdots v_{n(\varphi)-1}} \\
&\iff \mathcal{I}' \frac{\mathcal{I}'(c_0) \cdots \mathcal{I}'(c_{n(\varphi)-1})}{v_0 \cdots v_{n(\varphi)-1}} \models \varphi && \text{(by the Substitution Lemma)} \\
&\iff \mathcal{I}' \frac{c_0^{\mathfrak{A}'} \cdots c_{n(\varphi)-1}^{\mathfrak{A}'}}{v_0 \cdots v_{n(\varphi)-1}} \models \varphi \\
&\iff \mathcal{I}' \frac{\beta(v_0) \cdots \beta(v_{n(\varphi)-1})}{v_0 \cdots v_{n(\varphi)-1}} \models \varphi && \text{(by (3))} \\
&\iff \mathcal{I}' \models \varphi \\
&\iff \mathcal{I} \models \varphi && \text{(by the Coincidence Lemma).}
\end{aligned}$$

It follows that  $\mathcal{I}' \models \Phi'_0$  by (2). Thus  $\Phi'_0$  is satisfiable. □
